

Traffic Detection and Monitoring Systems

Because they can look directly into the sun and still detect traffic, FLIR cameras let you position them anywhere, maximizing safety and traffic detection.

FLIR's thermal cameras provide high-performance, 24-hour traffic and bicyclist/pedestrian monitoring capability by deploying a cutting-edge imaging technology that performs beyond anything else in the traffic monitoring market space.

Traffic Detection and Monitoring systems provide clear, sharp imagery regardless of lighting conditions. They're immune to:

- Direct sunlight – even at sunrise and sunset
- Headlights
- Reflections
- Light fog

Applications for FLIR's Traffic Detection and Monitoring systems include:

- Traffic Flow Monitoring
- Bicyclist and Pedestrian Detection
- Vehicle Counting
- Tunnel Safety
- Incident Detection
- Construction Liability
- Animal Warning

FLIR's Traffic Detection and Monitoring systems are drop-in replacements for existing CCTV traffic detection cameras, so they're:

- Easy to install
- Easy to integrate with analog video output
- Easy to maintain with no optical lens to clean
